How would you describe the course in 10 words or less?

- Broadening view of statistics beyond textbooks
- Engaging, entertaining, interesting.
- good content, covered relevant aspects, great presenter
- Easy to digest for a novice while having thoughts stretched
- Entertaining with pearls of statistical wisdom
- Excellent course on fundamentals of statistical thinking in medical research
- Engaging, motivating, detailed
- A great introduction to statistics but more importantly good study design
- Specific, engaging, interesting
- Engaging, relevant, applicable, fundamental principles of research
- An overview of the issues associated with quant research methods.
- Interesting advice on how to publish articles that are relevant and easy to read
- The course was relevant, interesting and educational. I thoroughly enjoyed the presenter.
- Fun, enjoyable, interactive and engaging course
- Informative, thought provoking and inspiring.
- Engaging and valuable
- Practical and in easy to understand language
- Practical and easy to digest nuggets of wisdom about Statistics
- A brutally honest look at bio stats with a focus of best practice that debunks some myths
- made me think more about the quality of research

- guide on what to do/not to do with statistics
- I see no word counter, so here I go: Adrian rocks. His irreverence and ability to call out subversion and manipulation in science & research gives me hope. A disproportionate number of senior researchers believe their own bullshit and lie their way to the next \$ pot - it's demoralising. Thanks, Adrian for your disruption and paving a better path for the patients and communities we serve.
- Broad but interesting and engaging way to approach statistical thinking
- Excellent overview of statistical analysis and presentation
- A high level overview of how one things about statistically presenting scientific results

What is the single greatest thing we could have done to improve your experience?

- Coffe break with some treats
- Small group tutorials/interactive sessions don't work with big groups sitting in long rows. Smaller numbers in round table layout would be better. Include opportunity pre course to submit questions/challenges that could be addressed.
- A room with a window
- Discuss topics applicable to my field (which would not suit the rest)
- If possible, providing pre-reading material before the course
- Include more practical examples of how to choose appropriate statistical methods. Understand a key message is to avoid 'statistical recipes' - however what is the alternative?
- if possible, another workshop could focus on robust analysis and write up? (Part 2)
- A list of recommended texts and resources coveing some of the basics, in terms of quant methods and statistical analyses. Textbooks or online resources. Theres so much out there, and if you're not confident, or have been out of the education scene for a while, it's difficult to know where to go for good advice or reliable info.
- Provided water
- Not quite sure, I think it was fine.
- It would be helpful to have the slides available in a format that we can download and save (I couldn't figure out a way to do this using the link provided to access the slides online)
- Use a roving microphone for questions on the floor for everyone to hear.
- Used a bigger room with adequate space to have group discussion
- Nothing really - the course was great, experience could have been improved with a larger room with tables to sit around for group discussion - but i would attend this again as it was.
- some step by step practical guidance. eg common healthcare studies - best way to approach analysis, important considerations and take home information on next steps to improve statistical thinking
- Increase the microphone/ audio volume
- A few more practical steps when approaching data presentation or communicating outcomes (lots of good negative examples of what to avoid shown, some pointers of deciding which good things would a help too)
- Randomisation section was not relevant for my area of research but still found the session interesting.
- Condense the course, provide specific examples of how to perform regression, tests, dealing with censored data, dealing with missing data. I essentially got a small taste of how a statistician thinks about these data, with no takeaways for how I could use this in my actual research.
